The sequence represents human INTERCEPT 289 form 2a polypeptide. This protein and similar others exhibit the ability to affect growth, proliferation, survival, differentiation, activity, morphology, or movement/migration of, e.g. T cells and cells of the heart, liver, pancreas, placenta, brain, lung, skeletal muscle, kidney, spleen, lymph node, peripheral blood leukocyte, bone marrow or thymus tissue. They can be used as modulating agents for regulating cellular processes, thus, the proteins and their associated nucleic acids can be used to prognosticate, prevent, diagnose, or treat disorders associated with physiological processes. These disorders include abnormal blood coagulation, asthma, anaphylaxis, hepatitis, multiple sclerosis, cancer, coronary artery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid molecule for diagnosis, prevention, and therapy of human and other animal disorder, or as modulating agent for regulating

The invention relates to secreted polypeptide-related proteins and nucleic acids (TANGO and INTERCEPT proteins and nucleic acids). The nucleic acids, proteins and antibodies specific to the proteins are nucleic acids, proteins and antibodies specific to the proteins are useful in screening assays, predictive medicine (e.g. diagnostic assays, proprostic assays, proprostic assays, monitoring clinical trials and pharmacogenetics) and propristic assays, monitoring clinical trials and pharmacogenetics) and diagnosing, preventing or treating proliferative disorders (e.g. anultiple sclerosis or lugus), neurological disorders (e.g. multiple sclerosis or lugus), neurological disorders (e.g. Alzheimer's disease or Parkinson's disease), cardiovascular clisorders (e.g. promocardial infarction or congestive heart disease), blood platelet disorders (e.g. thrombocytopenia or anaemia) and disorders involving blood vessels (e.g. thrombocytopenia or anaemia) and disorders acids may also be used in chromosome mapping, tissue typing and forensic bology, and as surrogate markers. This sequence represents a secreted polypeptide-related protein of the invention. Note: The sequence data for this patent was obtained in electronic format directly from USPTO at

                                                                                                                                                                          The invention relates to isolated nucleic acid molecules encoding novel human secreted extracellular matrix proteins (SPs). The polynucleotides and proteins are used to prevent, treat a medical condition in e.g. humans, mice, rabbits, goats, horses, dogs, chickens or sheep. For example, disorders associated with decreased expression of SPs. The SP polynucleotide or a vector expressing them may be administered to treat diseases by gene therapy. Antisense molecules may be administered to down regulate expression of SPs by binding with the cells own genes and preventing their expression. The polynucleotides may also be used as DNA probes in diagnostic assays. The SPs may also be used as antigens to
                                                                                                                                                                                                                                                                                                                            produce antibodies and to identify modulators (agonists and antegonists) of the SPs. The anti-(SP) antibodies and antagonists may also be used to down regulate expression and activity of SP and as diagnostic agents for detecting the presence of SPs in samples. The disorders include for example: immune/autoimmune diseases (e.g. HIV (human immunodeficiency virus) infections, anaemia, rheumatoid arthritis and multiple sclerosis), cancers and hyperproliferative disorders (e.g. melanomas, neoplasms of the breast or liver, Sezary syndrome and Gaucher's disease), neurological diseases (e.g. Alzheimer's disease, Parkinson's disease) cardio-forebrowscular disorders (e.g. cardiac arrest, tachycardia and angina), infections caused by bacteria, viruses and fungi and ocular disorders (e.g. corneal infections). Other uses include wound healing, maintenance of organs before transplantation, support of cell culture of primary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CGSKGFMCSQCSRCPNLWMRNGSHCYYFSMEKRDWNSSLKFCADKGSHLLTFPDNQGVNL 121

medical conditions e.g. by protein or gene therapy. The genes are solated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and over cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or unogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune heamolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as mycocardial isohaemias; (d) wound healing (c) cardiovascular diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infectious diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        122 FORYVGE-DFYWIGLRDID---GWRWEDGPALSLSIL-----SNSVVQKCGTIHRCGL 170

```
The invention relates to an isolated nucleic acid molecule (CDNA) encoding a human extracellular matrix protein, representing one of 161 novel genes. Also include are recombinant vectors, host cells (expressing the protein), the extracellular matrix proteins (including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acids and polypeptides, useful for diagnosing, treating, and/or preventing disorders, such as cancer, infections, cardiovascular and inflammatory diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 11; SEQ ID NO 310; 235pp; English.

production of other cytokines in other cell populations. The populations of other cytokines in other cell populations. The polymucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, nematopoiesis regulating activity, issue growth factor activity, immunomodulatory activity and activity inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leudaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                   The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   wound; ulcer; thrombocytopaenia; osteoporosis; osteoarthritis; inflammation, Alzbeimer's disease; Parkinson's disease; stroke; Huntington's disease; amyotrophic lateral sclerosis; HIV; immune deficiency; human immunodeficiency virus infection; severe combined immunodeficiency; infection; autorimmune disorder; rheumatoid arthritis; Guillain-Barre syndrome; graff-versus-host disease; cancer; thyroid cancer; lung cancer; small cell carcinoma; Asposi's sarcoma; brain tumour; prostate cancer; ovarian cancer; leukaemia; inflammatory disorder; criflammatory disorder; crohn's disease; food supplement.

The invention relates to an isolated polynucleotide encoding a cytokine or cell proliferation/differentiation-related protein (or the mature protein or active domain), sequences greater than 90% identical to it or sequences complementary to it. Also included are the encoded proteins, expression vectors, transformed host cells, antibodies, and identifying compound that binds to the polypeptide. The polymucleotide, polypeptides compound that binds to the polypeptides. They are particularly useful conforded by it, or antibodies to the polypeptides. They are particularly useful conforded by it, or antibodies to the polypeptides. They are particularly useful conforded by it, or antibodies to the polypeptides. Wounds, ulcers, thrombocytopaenia, osteoporosis, osteoarthritis, inflammations, chrombocytopaenia, osteoporosis, stroke, immune deficiency of e.g. human immunedaticiency virus (HIV), severe combined immundeficiency or infections), autoimmune disorders (e.g. rheumacoid arthritis, Guillain-conformed or graft-versus-host disease), cancers, thy conforders (e.g. thyroid cancers, ung cancers, small carcinoma, kaposis, sarcoma, brain cumours, prostate cancer, ovarian cancer or leukaemias), or inflammatory disorders (e.g. inflammatory bowel disease or Crohn's disease). The conformed in hithistory or anyonists that are useful for screening applieds or small

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                               Key
             AAU00675
                      The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to oytokine, call proliferation or cell differentiation or which may induce production of other cytokines in other cell appollations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5
                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         98 SSLKFCADKGSHLLTFPDNQGVNLFQEYVGEDFYWIGL-RDIDGWRWEDGPALSLSIL-- 154

New isolated nucleic acid molecule for diagnosis, prevention, and therapy of human and other animal disorder, or as modulating agent for regulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence represents human INTERCEPT 289 form 2a polypeptide. This protein and similar others exhibit the ability to affect growth, proliferation, survival, differentiation, activity, morphology, or movement/migration of. e.g. Teells and cells of the heart, liver, pancreas, placenta, brain, lung, skeletal muscle, kidney, spleen, lymph node, peripheral blood leukocyte, bone marrow or thymus tissue. They can be used as modulating agents for regulating cellular processes, thus, the proteins and their associated nucleic acids can be used to prognosticate, prevent, diagnose, or treat disorders associated with physiological processes. These disorders include abnormal blood coagulation, asthma, anaphylaxis, hepatitis, multiple sclerosis, cancer, coronary artery disease, malaria, atopic dermatitis, amyotrophic lateral sclerosis, meningitis, attention deficit disorder, Crohn's disease, gastroenteritis,
